

Roman Novatorov

Backend engineer focused on the reliability of distributed systems. I design services that stay correct under failures, concurrency and high load.

Experience

Software Engineer at **Enapter** (2020-10 - Present)

I currently own core backend subsystems for a fleet of 12,000+ electrolyzer stacks in 55+ countries.

- Architected a data warehouse (~7 TB) for cross-device telemetry aggregation
- Extracted 10+ microservices during a migration from a monolith
- Built an event-sourced saga engine providing metadata consistency across 50+ IoT gateways
- Developed an open-source [MCP server](#) exposing the platform to AI assistants
- Created two [custom Grafana plugins](#) for timeseries visualization and device command execution, shipped in the customer-facing Grafana (300+ dashboards)

Tech: Go, Python, C, Lua, gRPC, HTTP, MQTT, MCP, Postgres, TimescaleDB, RabbitMQ, Redis, Docker, Ansible, Kubernetes, Grafana, Prometheus

Software Engineer at **TradingView** (2019-01 - 2020-10)

Worked on a high-load reverse proxy distributing real-time market data to 10M+ monthly active users.

- Designed a consistent-hashing routing subsystem with dynamic node discovery
- Owned and extended an integration testing framework
- Automated load testing to validate proxy performance

Tech: Go, Python, HTTP, ZooKeeper, Docker, Keepalived

Test Automation Engineer at **Navico** (2017-04 - 2019-01)

Maintained an automated regression testing suite for backend APIs of marine cartography products.

Tech: Python, HTTP, AWS

Education

Self-taught, with university coursework in:

- **Infocommunication Technologies** at **ITMO University** (2016 - 2017)
- **Foreign Languages** at **Omsk State Pedagogical University** (2013 - 2016)

Languages

- English (fluent)
- German (upper intermediate)

- Russian (native)
